

1 ABSTRACT OF THE DISCLOSURE

2 A decorative light supporting assembly includes a bonding element having
3 multiple V-like bodies interlinked with one another, multiple support branches each
4 having a frame with multiple protrusions integrally formed with the frame and an
5 arrow-shaped connector integrally formed on a bottom of the frame and being inclined
6 relative to the frame such that insertion of the arrow-shaped connectors from the support
7 branches into corresponding V-like bodies is able to secure engagement between the
8 bonding element and the support branches.
